Source: Wikipedia/AutoCAD AutoCAD is a commercial computer-aided design (CAD) and drafting software application. Developed and marketed by Autodesk, AutoCAD was first released in December 1982 as a desktop app running on microcomputers with internal graphics controllers. Before AutoCAD was introduced, most commercial CAD programs ran on mainframe computers or minicomputers, with each CAD operator (user) working at a separate graphics terminal. AutoCAD is also available as mobile and web apps. Although AutoCAD has been installed on millions of desktop computers, it was introduced into the world of manufacturing in 1983 and has since become a very popular tool for design, documentation and analysis. Over the years, the program has evolved to become increasingly powerful and feature-rich. 3D Modeling 3D Modeling can be done in either 3ds Max or Blender. 3D modeling on CAD is not considered an easy task, and the resulting file format can have very complex structures. AutoCAD and other CAD systems produce 3D objects in a file that is based on the geometry of the CAD system, not the object to be created. In 2016, Dassault Systèmes, 3D Systems and Autodesk released the Autodesk 3ds Max plugin for AutoCAD, a plugin that allows AutoCAD users to import, edit and create 3D models in 3ds Max. 3D printing AutoCAD LT supports 3D printing. Before he could even muster the courage to turn his head, he felt more material being splattered across his face. He immediately jerked away, sending all the creatures scattering. Abraham wiped his face with his hands, still too dazed to fully process what had happened. "What the hell was that?" The stranger did not answer. Abraham looked up just in time to see the stranger suddenly disappear, having swiftly scampered into the city. "Damn it, I'm not going to leave the city!" A minute later, he saw a group of strange beasts lurking around a pile of rubble. One of them emerged and gaped at Abraham in a single gulp. Abraham's eyes bulged as he realized that the creature was a golden-brown wolf. "Are you sure?" Abraham could not believe his eyes. Then, he recognized the figure in the middle of the wolves. It was a man-wolf wearing a long, oversized cloak that cinched at his waist and drooped to his feet. He had gone through the same battle as Abraham. Abraham was the only survivor of the horde of creatures, and the man-wolf had been the leader of the pack ca3bfb1094

Go to: File->New->Structure from Point->Add. In the opened dialog put the coordinates of the points you'd like to create. The Autocad will prompt you to create a polyline. Hit OK. Hit SEND. The circle will be saved as a DWG. A: For sure this can not be a good solution for complex drawings or really big models. But if you are not able to use a 3d solid modeling software like Blender or 3d Max, this method is very easy to use. In the center of your picture (for example the vertex of the polyline you created) draw a circle with radius that's of the size you need, and you will get that polyline: Go back to that polyline and select Delete. Add your polyline as is (Make sure you have no constraints, edge loops etc.) and you are done. As others mentioned, you will not be able to use a boolean operation (or otherwise) to make sure the part you want to cut out is the hole of the polyline: A: Using polylines with boolean operations is indeed the most direct solution to the problem (regardless of your limitations in terms of existing tools). In fact, the startpoints of the edges are just points in Autocad. The order is different, but the points should be spaced the same (which is specified in the properties of the polyline). With the polyline selected you can perform an intersection operation. In the dialog select "Intersection (Intersection)" and enter the edge length. To make the polyline appear in the intersection you select it and press "Select". You'll have to make sure that the polyline startpoints are aligned. If the polyline does not start at the same point, then perform the intersection operation from the point which is aligned to the startpoint of the polyline: If your model has a lot of edge loops, then you'll need to make sure that the edge loops are kept when performing the intersection operation. If you delete the edge loops, you will lose the ability to perform the intersection operation from the points on the loop edges. So to solve this, you can select the edges and right click, choose "keep selection", or you can make sure that the edge loop select is enabled (right click on the polyline > Properties > Modify > Display > Edge Loops
